Introduction

Godot and Unity are two game engines, which are tools used to create and run video games. Both are especially popular among beginner and indie developers. This paper will be documenting my analysis of the usability of these two tools. To conduct this evaluation, I chose and completed 10 tasks, each of which is integral to making a game. Each of these tasks would also be done by beginner users looking to create their first game with these tools. These beginner users would be familiar with programming logic, but completely new to game design and development.

Methodology or Methods

Tasks

Task 1: Create a new project

Task 2: Insert custom sprite

Task 3: Insert Sound

Task 4: Attach a script

Task 5: Create reusable element

Task 6: Map Controls to Actions

Task 7: Test run game

Task 8: Attach Collision Capabilities

Task 9: Manual Debugging

Task 10: Save/Export project

Test Environment

This test was done on my Dell laptop running Windows in my home. I used Godot 4.6.2 and Unity 4.6. Realistically, this test could be completed anywhere on any device capable of running the engines, but I felt this environment best represented the beginner game developers I was envisioning.

Evaluative Criteria/Rating Scale

In order to properly and uniformly compare the two engines I will be grading each task using the following five categories.

Efficient - I was able to accomplish what I set out to do

Effective - I could get my task done quickly without extra or unnecessary work

Engaging - During the task, I found the product enjoyable and appealing to interact with

Error Tolerant - When I make a mistake, the program makes it easy to fix it

Easy to Learn - I can quickly figure out how to complete the task without much guidance.

Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree

I will be using a 6-point Likert scale like the one shown above.

Results

Task 1: Create a new project

Godot:

Creating a new project in Godot is incredibly intuitive and easy to figure out. I required no outside research to complete this task. Assuming the user has already installed Godot, they must run the engine. Once running, the engine automatically shows a list of past projects (Figure 2), from which the user can choose to open an old project or click the Create button. From there, naming the project and clicking a second create project button is all that is needed in order to be launched into the project (Figure 1). In all, it took me three clicks to create a new project and I required no outside research to get through all the steps. After creating the project, Figure 3 automatically opened in a new window.

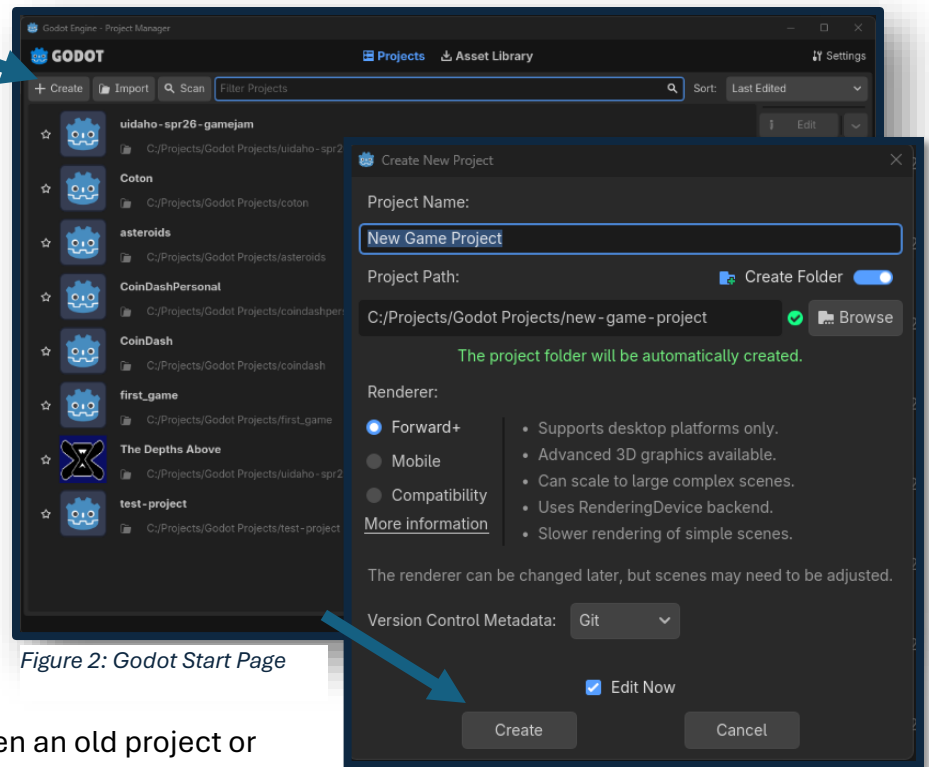

Figure 2: Godot Start Page

Figure 1: Godot Project Name

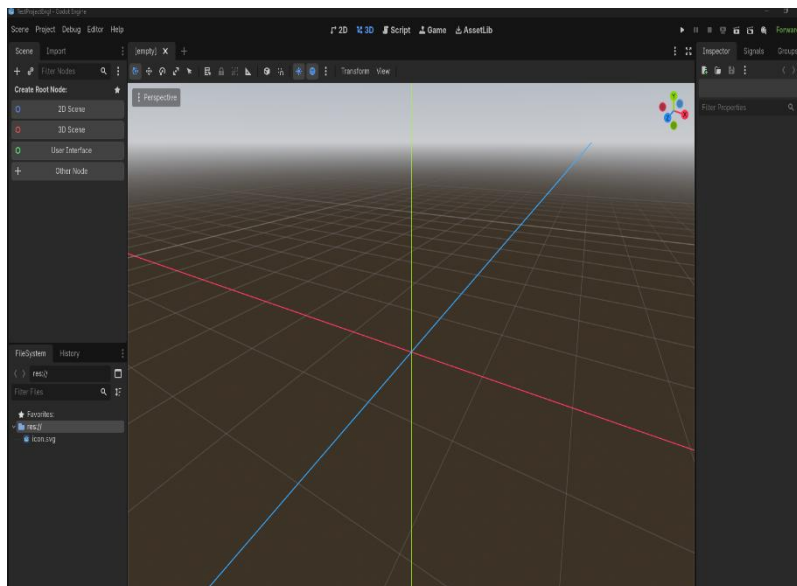

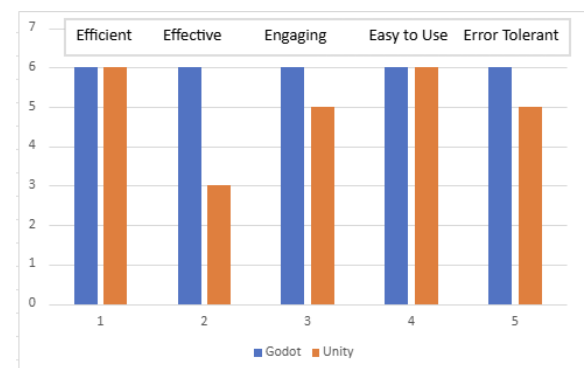

Figure 3: Godot Blank Project

Unity:

Creating a new project in Unity requires a little bit more research and prior knowledge. First a prospective user must know that Unity engine uses a separate environment called Unity Hub as a launching point for Unity, and in order to use this hub they will need to create an account. Then the User must know to navigate to the projects page, and they also must know exactly what kind of project they need to choose from a long list of presets (Figure 5), and enter the organization name associated with their account. In all, this can get very confusing and required many extra steps compared to the Godot project creation.

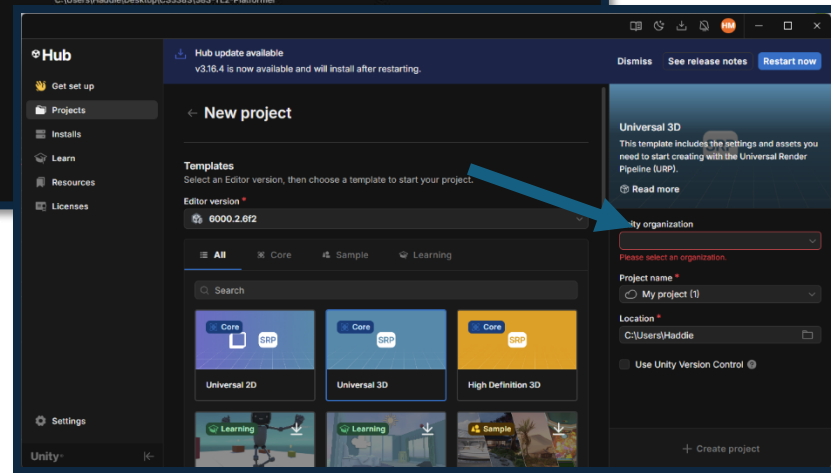

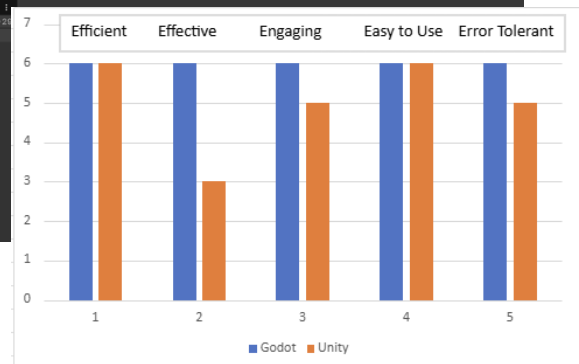

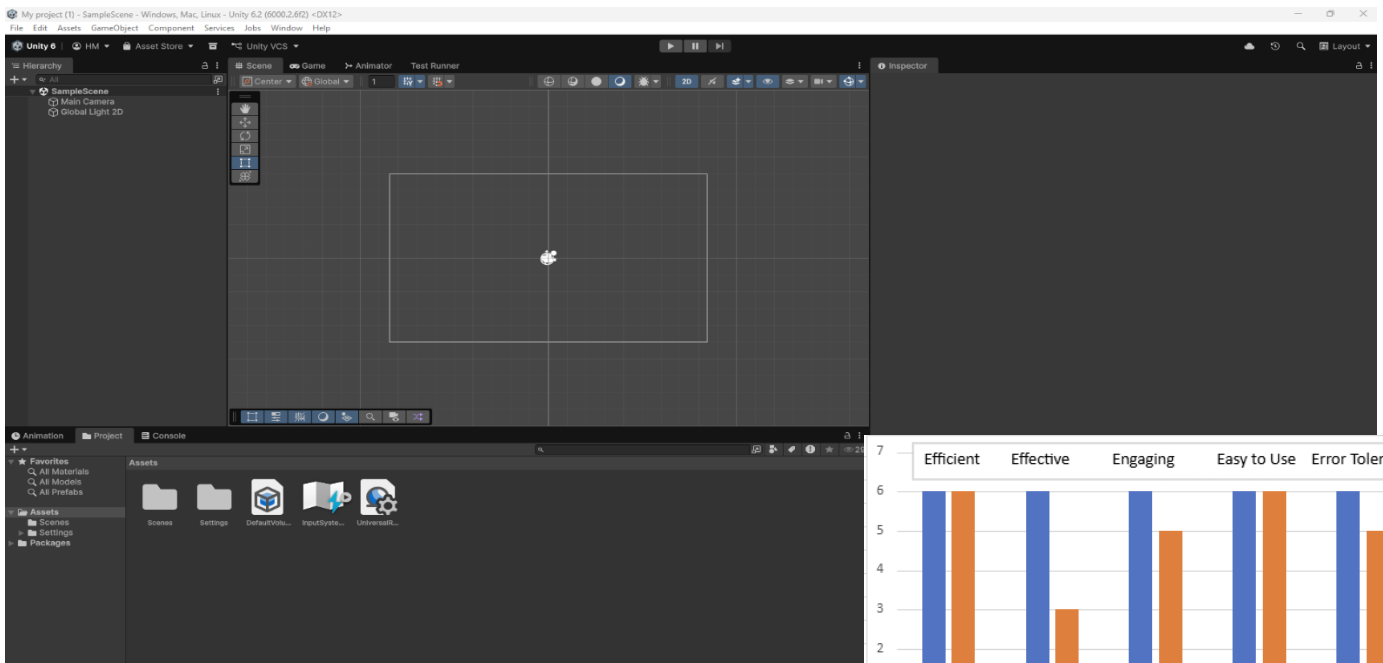

Figure 5: Unity Organization Name

Figure 6: Unity Blank Project

Task 2: Insert custom sprite

Godot:

Creating an animated sprite in Godot starts with importing the spritesheet, which is as simple as adding the spritesheet to the assets folder. From here it is a little more complicated, since the user has to create a new AnimatedSprite Node and create a Sprite Frame. From there the user must manually slice the sheet into the different frames (Figure 8). All of this manual insertion can allow the user to have more control over the sprite, but could get confusing for beginners.

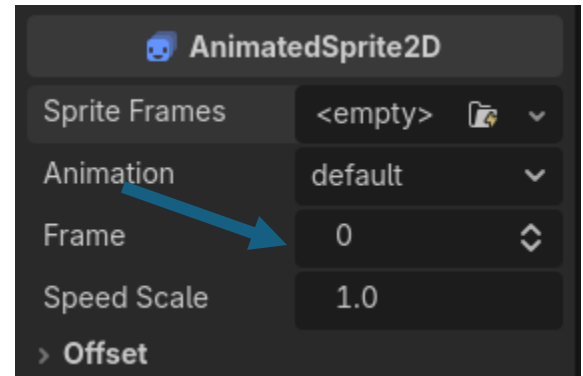

Figure 7: Inserting Sprite Frames

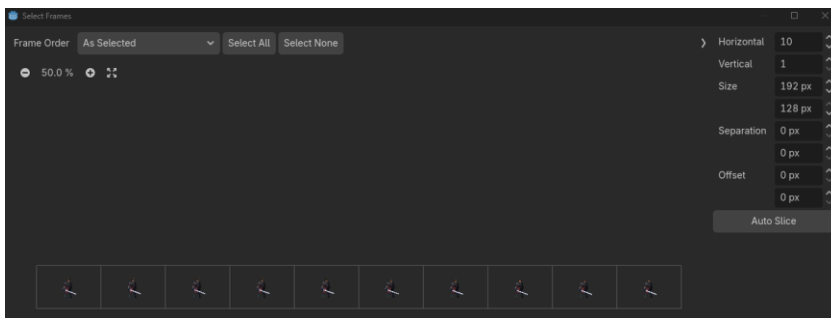

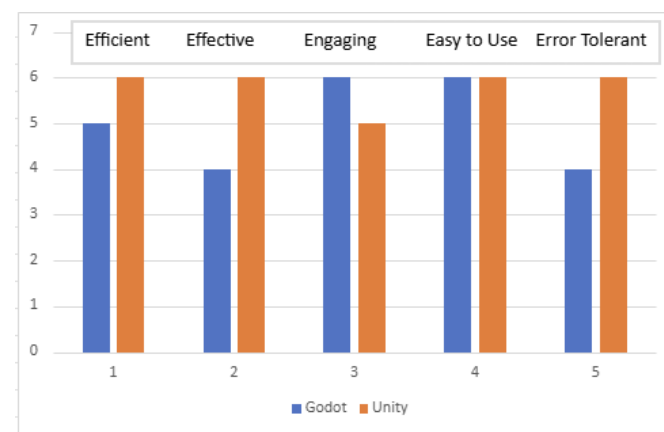

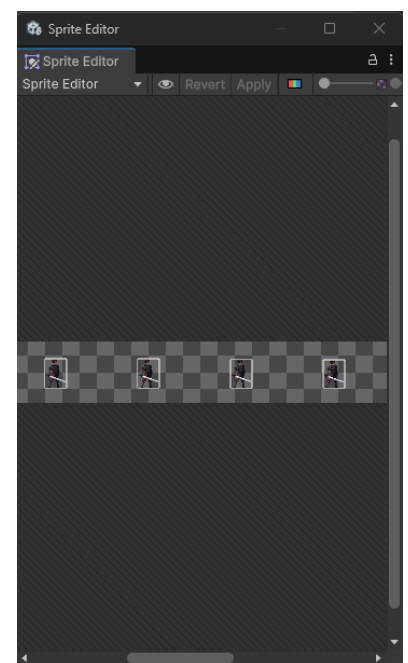

Figure 8: Manually slicing Frames

Unity:

Creating an animated sprite in Unity is incredibly user friendly and mostly automated. All that is required is to import the files, and if the user has configured their project correctly (in Task 1) the sprite frames will automatically slice into their separate frames (Figure 9). Then you drag the frames onto the project scene and Unity automatically creates an animation. In all it took 3 clicks. This process significantly reduces the number of steps required when compared to Godot and allows a user to see results quickly, making it easier to not be discouraged.

Figure 9: Automatically sliced frames

Task 3: Insert Sound

Godot:

Adding sound in Godot is a straightforward process. It requires importing the sound, adding an `AudioStreamPlayer` node (Figure 10), then attaching the correct sound to the audio node. This was very easy to figure out and implement, while there are more complicated settings that could be messed with, they are not required for a beginner project

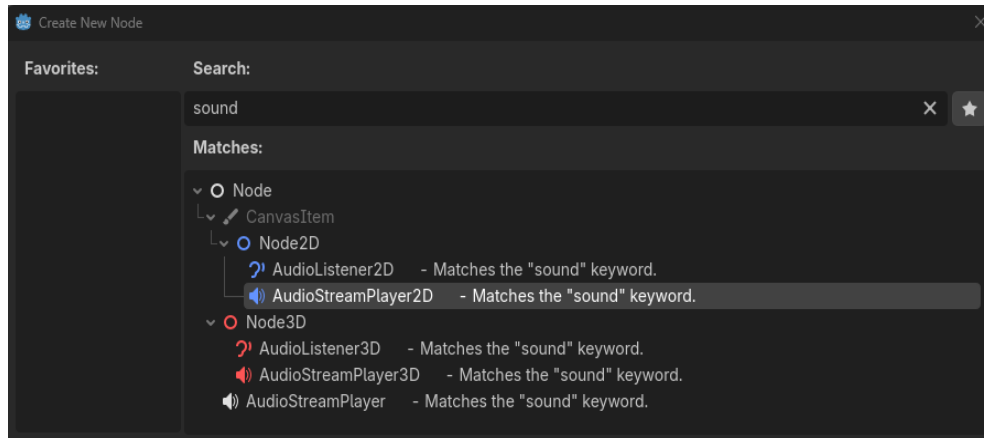

Figure 10: Godot `AudioStreamPlayer`

Unity:

Creating a sound in Unity is not as intuitive as it is in Godot. It requires setting both the Audio Source (where the sound is coming from) and the Audio Listener (where the audio is going to) (Figure 11). This does allow for more control as you get more advanced, but for a beginner this could be confusing.

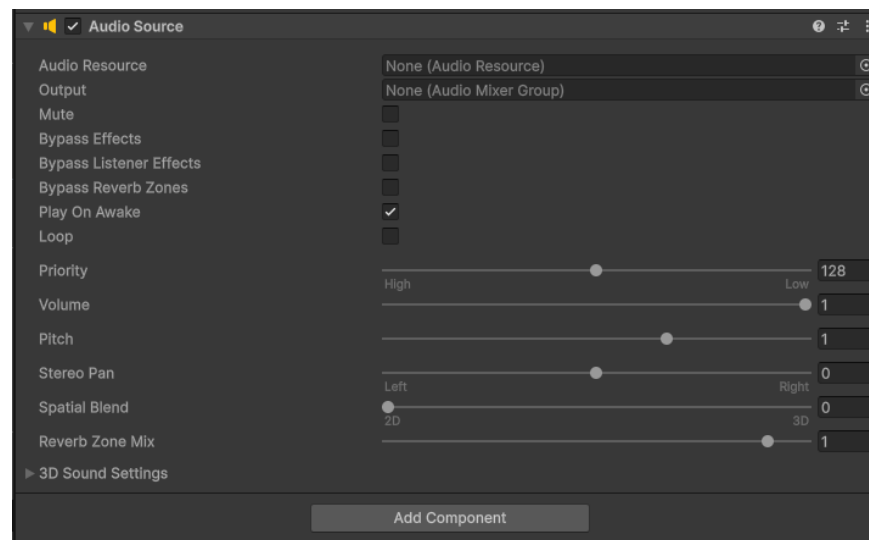

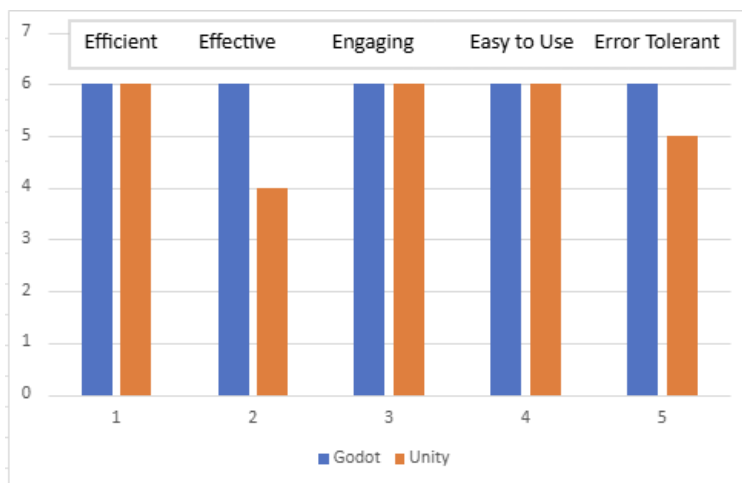

Figure 11: Unity Audio Source

Task 4: Attach a script

Godot:

In Godot, creating a script is very simple. First you right click on the scene you would like to attach your script to, then you create a script (Figure 12). In all it takes 4 clicks, counting the click it takes to rename the script.

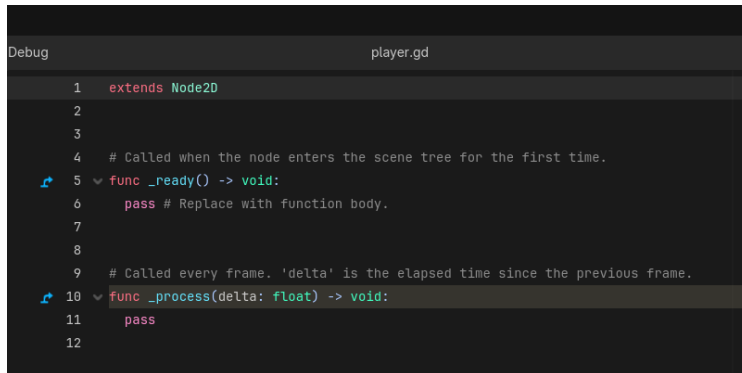

Figure 13: Template Script in Godot Interface

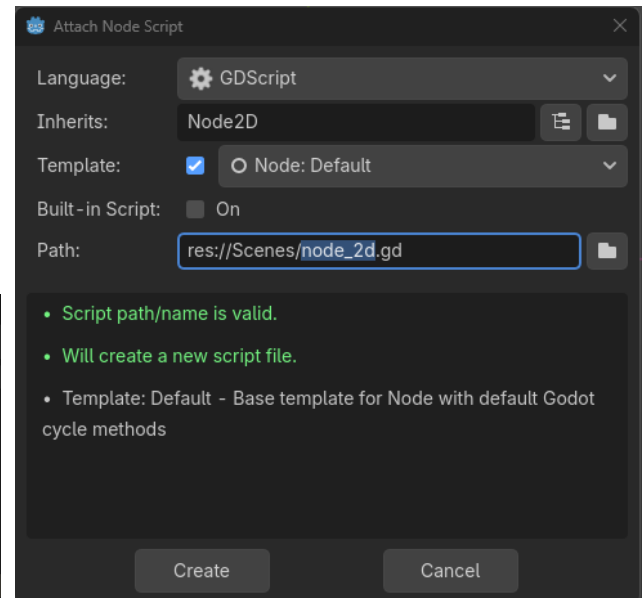

Figure 12: Create a New Script

Unity:

Creating a script in unity is equally simple. All it requires is creating a new script component, and naming it (Figure 13). The script can be edited in an external code editor. I used Visual Studio (Figure 15). While the process is simple, it is slightly less integrated with the engine than in Godot, as it often involves switching between the Unity editor and a separate coding environment

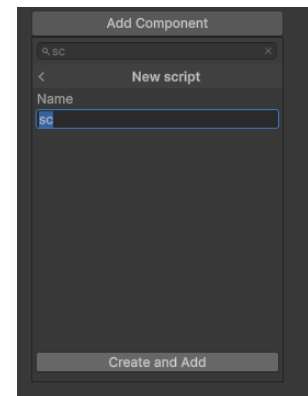

Figure 14: Create a New Script

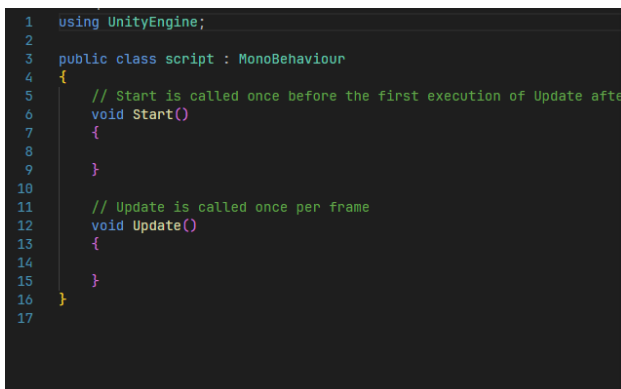

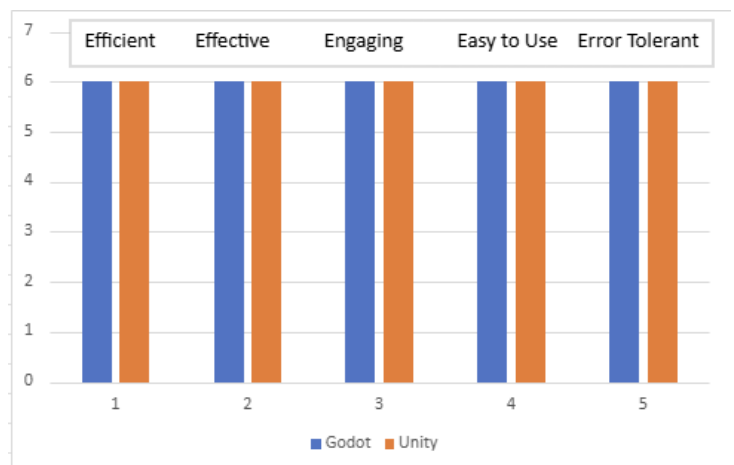

Figure 15: Template Script in Visual Studio Interface

Task 5: Create reusable element

Godot:

Since reusable elements are an integral part of game design, I had assumed that there would be more documentation of this on Godot webpages. However, it appears that there is not very much explicit discussion about how to create reusable elements. A user can save a “scene” and reuse it within other scenes (Figure 16), but this is not explained in detail.

There is also no system for modifying the single scene and having the results cascade through all uses of that scene. I fear that a beginner may not fully understand the importance of this feature or its place in game design due to the lack of discussion

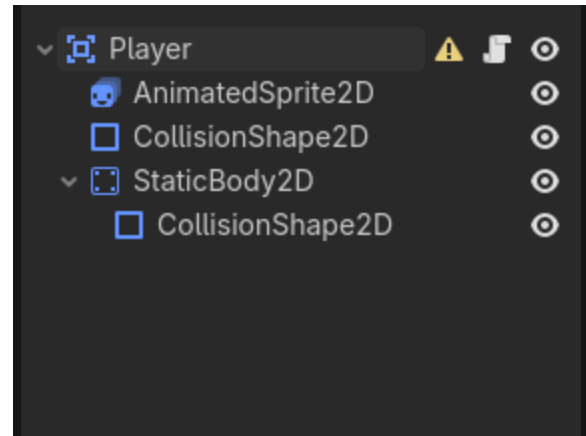

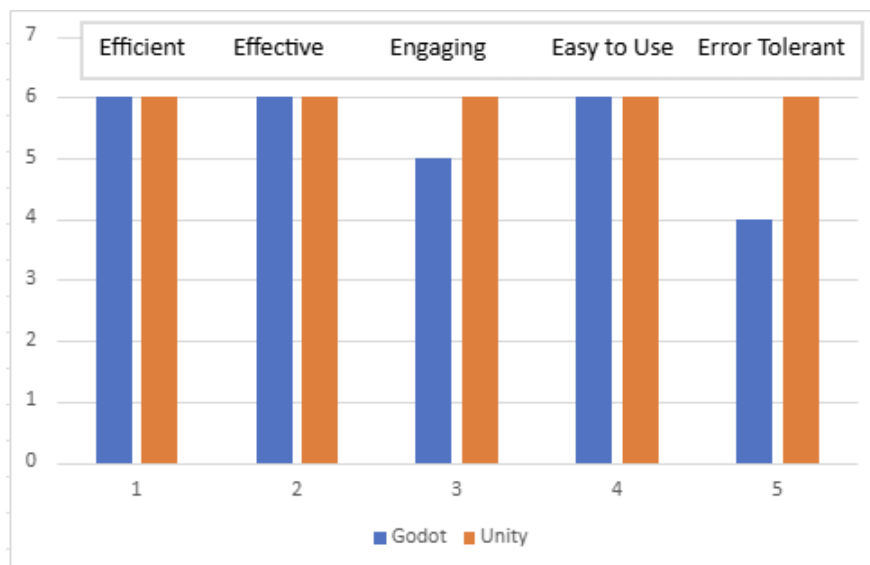

Figure 16: Example Scene

Unity:

Unity has a lot of explicit documentation and structures for creating reusable elements. Their version is called a “prefab” and just requires the user to drag a game object and drop it in the file system. Once created, the prefab can be reused and modified across different scenes, with changes automatically updating all instances (Figure 17).

Figure 17:
Example Prefab

Task 6: Map Controls to Actions

Godot:

Mapping controls to actions is simple in Godot, and it has an incredibly beginner friendly function where it detects the keystrokes input by the user (Figure 18). This way the mapping does not need to be done completely manually. This feature can be incredibly useful for beginners and advanced game designers alike.

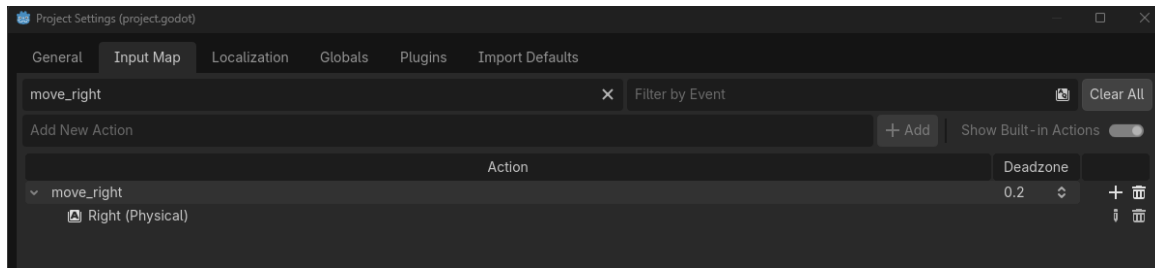

Figure 18: Move_Right Control settings

Unity:

Unity has two systems for mapping controls, and their newest system is very complicated and would take a beginner some time to learn. Additionally, it would require the installation of new packages using Unity Hub. Therefore, I chose to use the legacy system for this experiment, since it is much simpler and is still being supported. However, if Unity stops supporting this system this section will need to be updated. Using the legacy system, mapping controls is slightly more complicated compared to godot, and Unity does not have the keystroke detection system of godot. However, this system is otherwise very similar to the key mapping system of Godot.

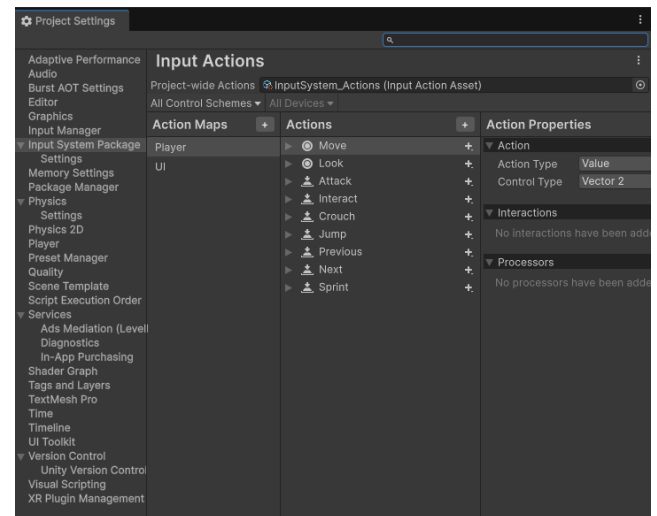

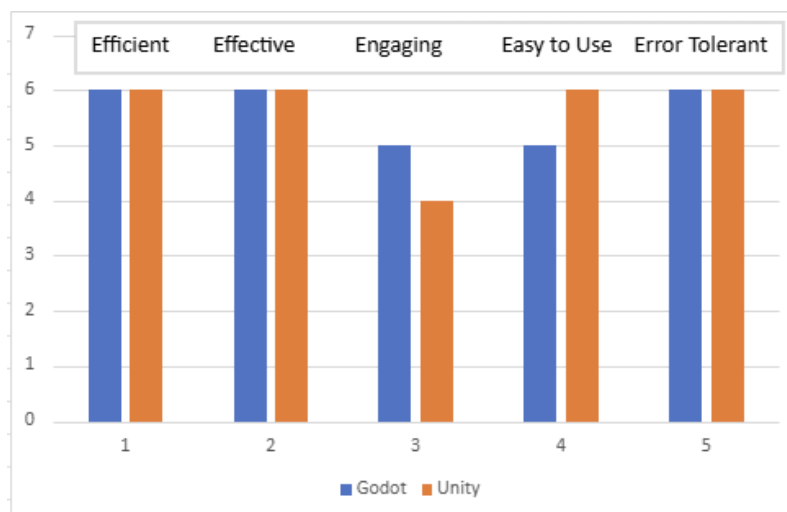

Figure 19: Control Settings using Legacy Unity System

Task 7: Test run game

Godot:

Test running in Godot requires clicking on the “Run Game” button, after which the game will begin playing in a new window (Figure 20). This clear separation between the editor and the running game makes it easy to understand what the player experience will look like.

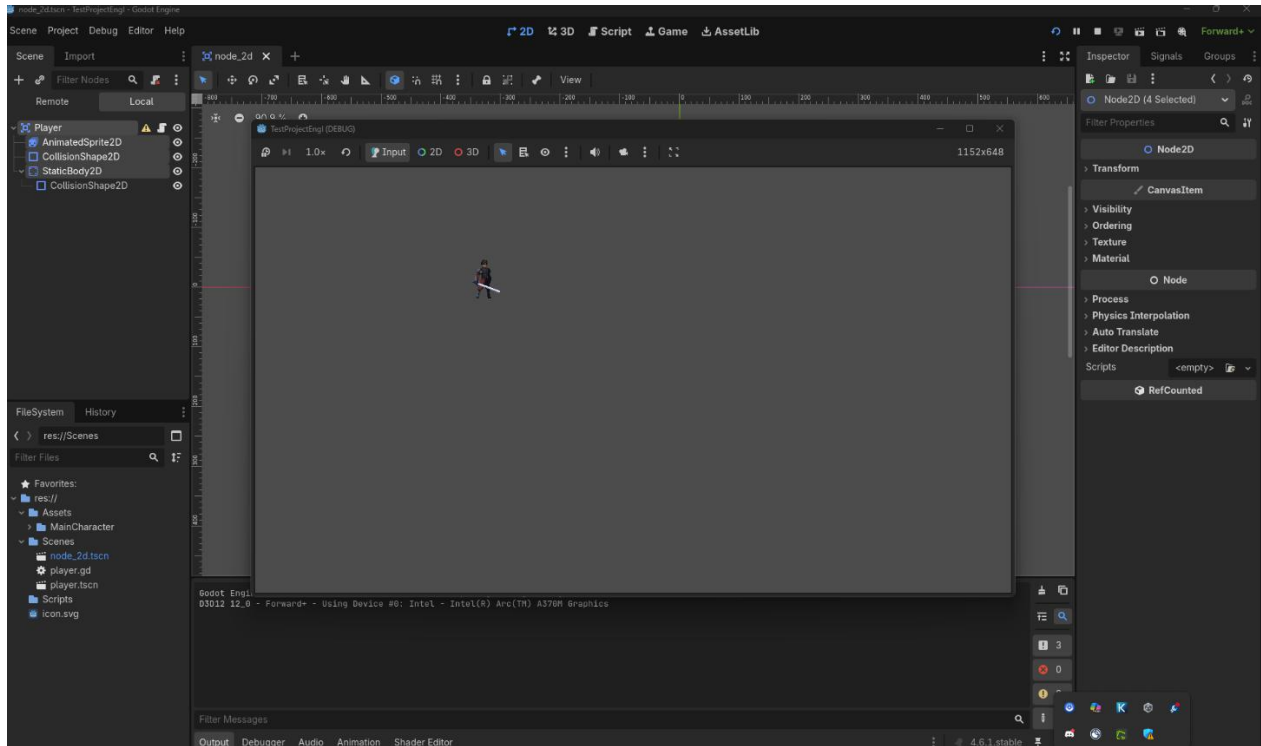

Figure 20: Gameplay Window

Unity:

In Unity, testing the game is also fairly straightforward. When you click the run button the simulation is run, however the game begins running directly within the editor (Figure 21). This can sometimes blur the line between editing and playing, which may get confusing for beginners.

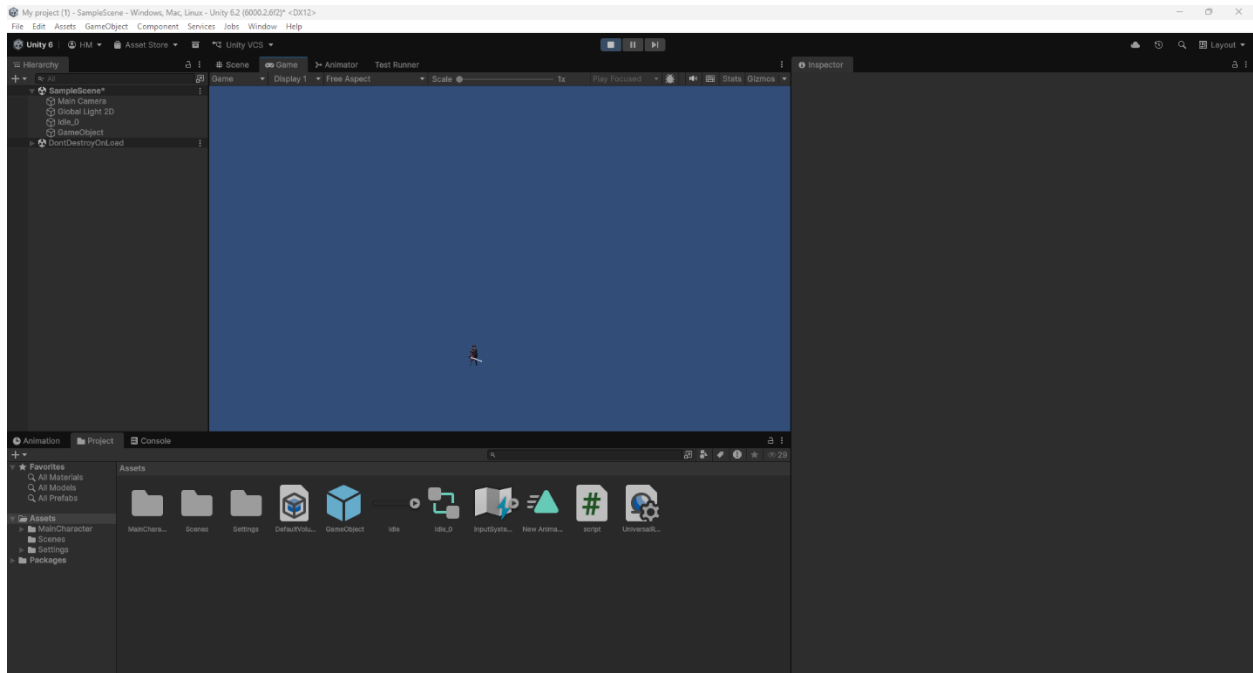

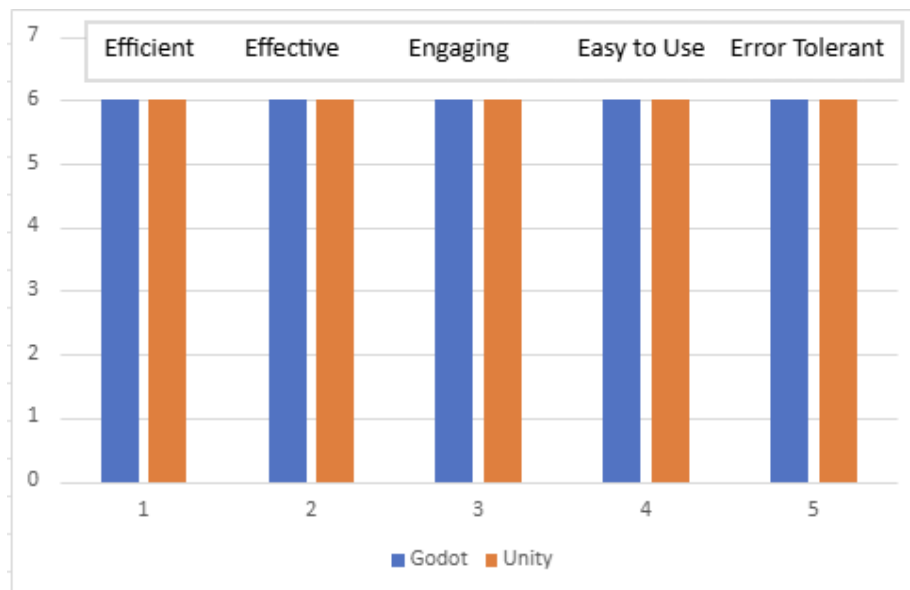

Figure 21: Gameplay Window

Task 8: Attach Collision Capabilities

Godot:

Collision Capabilities in Godot were fairly simple to implement, using a CollisionShape2D node (Figure 23) and several different default shapes. The visual tools (Figure 22) make it easy to align the collision area with the object, which helps prevent errors.

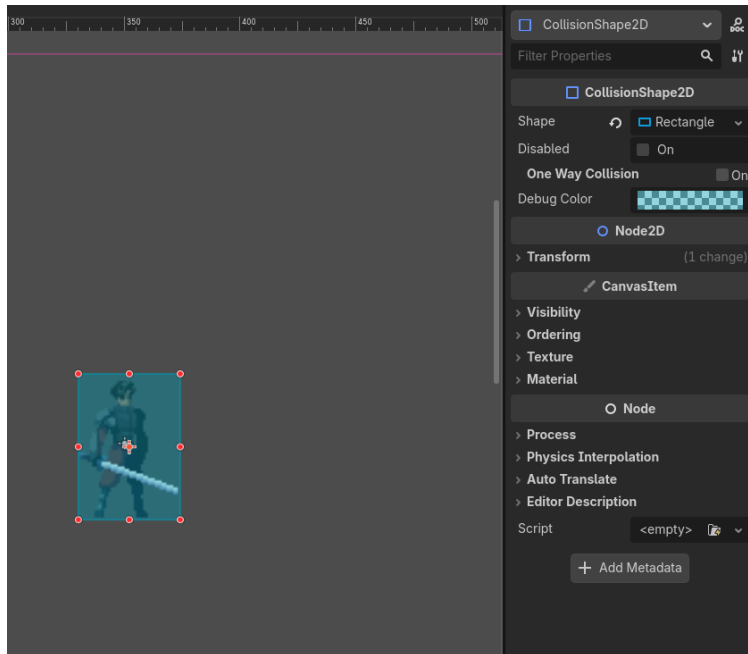

Figure 22: Resizing Collision Shape

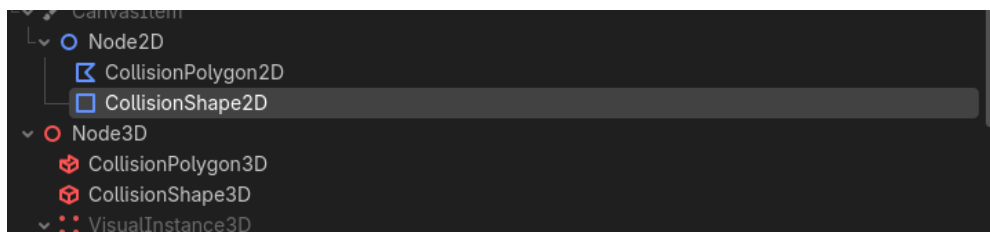

Figure 23: CollisionShape2D node

Unity:

Collision attachments in unity were equally simple, using a Collision and Rigidbody attachment and user friendly resizing. Users can easily add these components to objects and resize them using built-in tools. The process is comparable in difficulty to Godot and is also very beginner friendly.

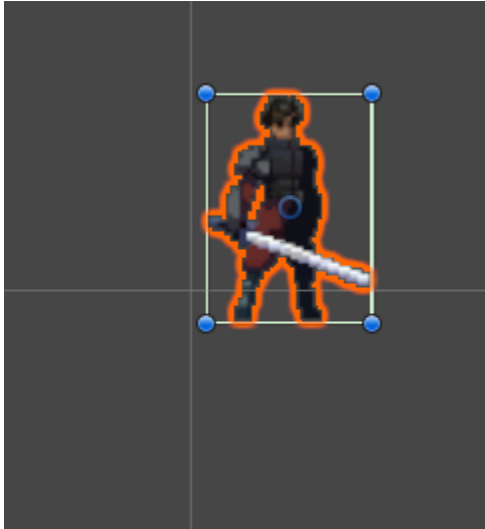

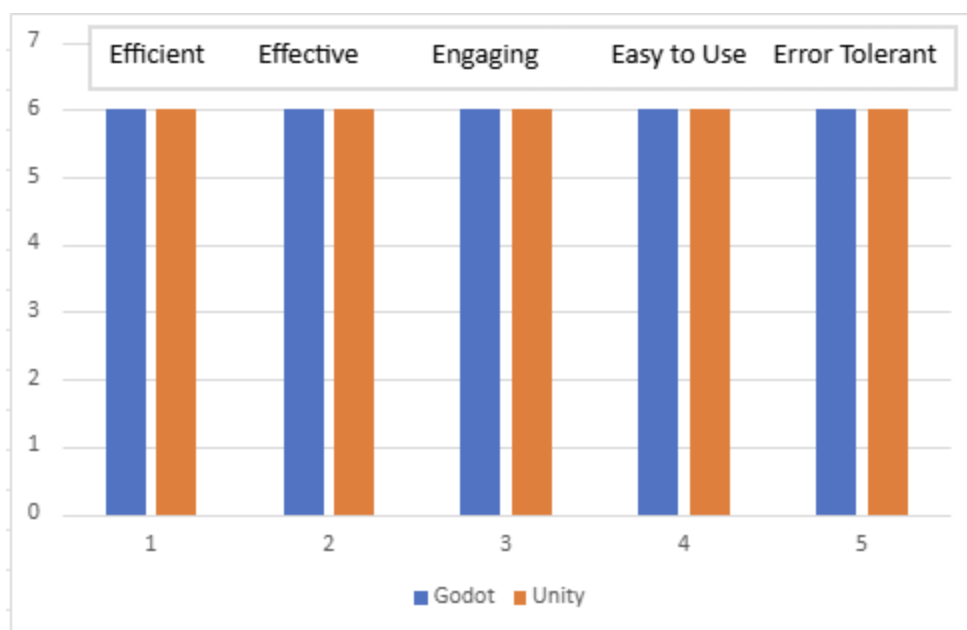

Figure 24: Resizing Collision Shape

Task 9: Manual Debugging

Godot:

Here I show an error I ran into where I misnamed one of my variables (Figure 25). The error was easy to find, since the debug screen showed the exact place where it was. This level of clarity is helpful for beginners who are still learning how to troubleshoot.

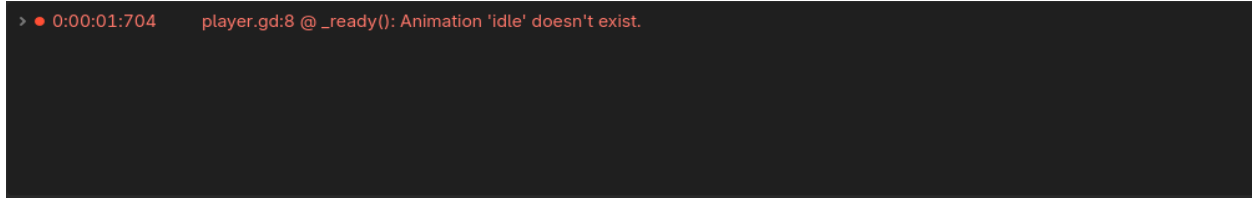

Figure 25: Misnamed Variable Error

Unity:

The debug screen in unity is very similar, and shows where errors occur (Figure 26). This makes it easy to track down and resolve issues. Both engines perform well in this area and offer useful tools for identifying mistakes.

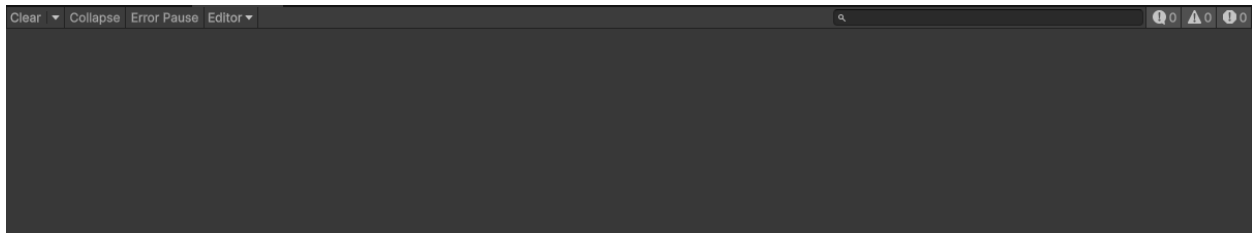

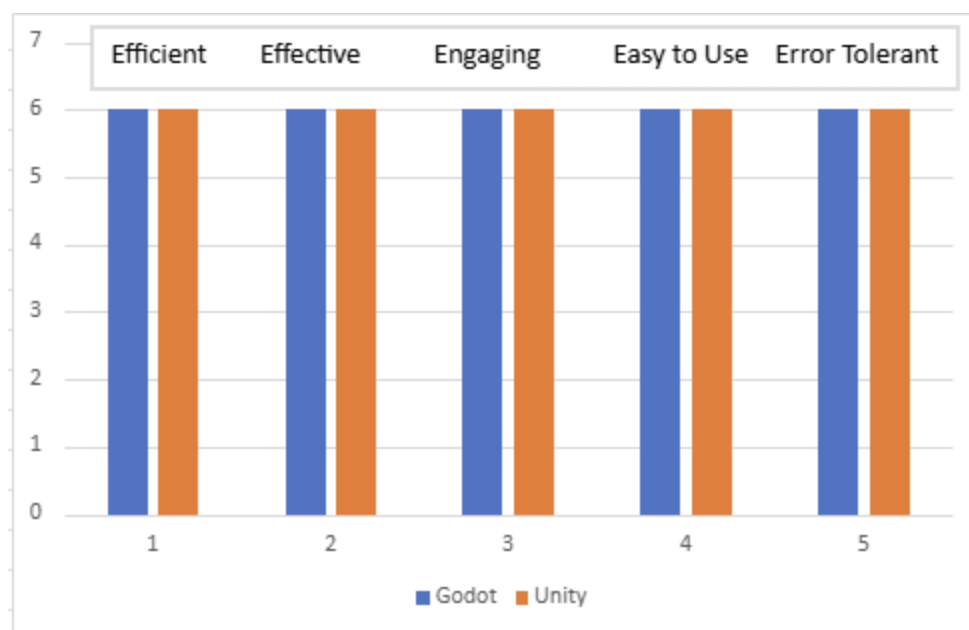

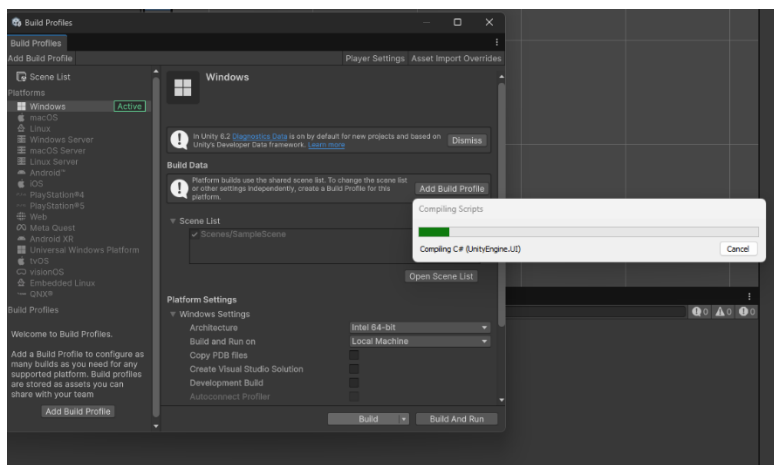

Figure 26: Blank Unity Debug Screen

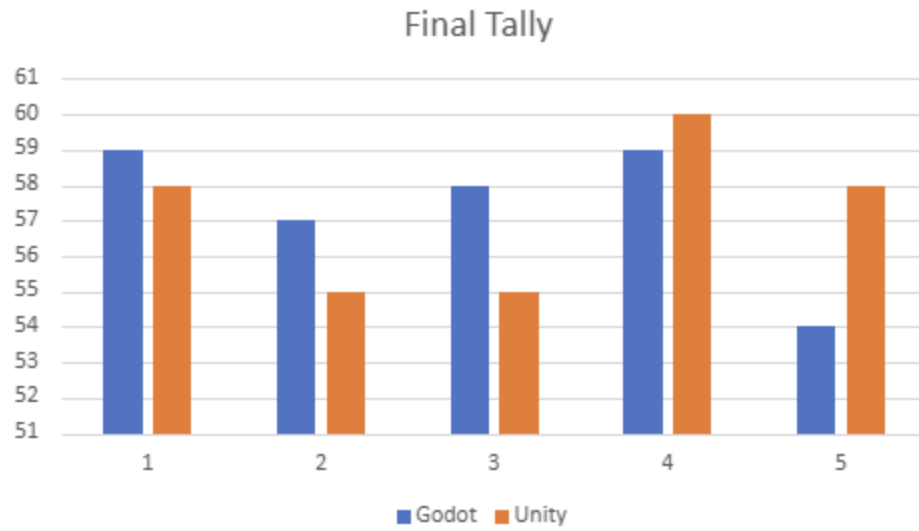

Figure 29

This final tally shows the results for each of the systems, in order of Efficient, Effective, Engaging, Error Tolerant, and Easy to Learn.

Discussion / Conclusion

In all, both engines are useful for beginners. Each one has strengths and weaknesses, but overall I would recommend Godot for complete beginners. Unity has more of an established community, which makes finding answers online easy. There are so many more forums and tutorials for Unity, and they tend to be more up to date with the latest version. Unity also lends itself to more user control, which is better for those who have more experience in the game design space.

Unity has more documentation and was easier to troubleshoot, but Godot is more generally beginner friendly. Godot's user interface also stands out, with many of its functions having a more polished and a less complicated feel. While there is less documentation available, there is enough to get a user started with their project without much trouble.
